Career Aspirations

My long- term career goal is to work in the game industry as a concept artist or a 3D artist. I am interested in creating characters, weapons, props, and other assets that can be used in games. My interest in this career comes from enjoying the process of taking an idea and turning it into something cool. Seeing my 3D models in a game for me feels like I have accomplished a lot. That's why game development gives me an opportunity to combine several interests, like storytelling, and animations as a way to make the player interactive experience more fun than just looking at plain art. I am interested in atmospheric and stylized work. I enjoy darker, surreal and emotionally charged designs. I want to develop a recognizable artistic style while being able to use different styles and work on different types of projects.

In order to succeed as a 3D artist in the game industry, I need a combination of technical skills, artistic, and the knowledge of game development workflows. I am currently using Blender as my 3D modeling software, it allows me to create the assets I need for every project I am working on. I know my limits when it comes to certain things in blender like rigging a character, i still need to get better at rigging my characters once i am done i will move to actually doing the animations myself. I've used mixamo for my animation because it is accessible and there was a deadline I needed to reach. I also have experience with unity, i understand i importing assets from blender to unity works and how assets function inside the game engine works as well. Another important skill is communication, between the programmer and the artist is very important. I had an experience when I was working on my first game jam. We ended up not submitting a game due to lack of communication between everyone.

One of my biggest strengths is that I enjoy learning through projects instead of only watching youtube tutorials. Another strength is that I am interested in multiple areas of game development. I have experience with 3D modeling, animation, game development, visual design, and storytelling. This gives me the ability to think about an asset from more than one perspective. However, I still have several areas that I need to improve on like rigging, animation, and optimization. I also need to become more comfortable with programming. I also need to improve my portfolio so that it clearly demonstrates my strongest abilities rather than simply showing everything I have created.

Over the next one to three years, I plan to focus on building a stronger portfolio while developing the technical skills necessary for professional game development. My first priority is to continue creating small but complete projects. I also plan to continue improving my knowledge of Blender and Unity. I want to become more comfortable creating optimized game-ready models, materials, animations, and effects. Learning more about shaders, scripting, and technical art will allow me to bridge the gap between traditional 3D art and game technology. My goal is not simply to have a large portfolio, but to have a focused portfolio that shows what I can contribute to a game development team.
